

# Realm Networks

---

## ***Realm Networks Anonymous FTP***

To enable the Anonymous FTP login to the Realm1000 Administration Interface (RAI) and click on "Network Services", then click on "Services". Look for the line "Anonymous FTP", if beside it it says "Enabled" you already have the Anonymous FTP enabled, otherwise if it says "Disabled" click on the word "Disabled" and it will change to say "Enabled". After this is done if you have no other changes to do to the box you may click on "Reboot Server Now" at the top, or wait until your next scheduled reboot for the Anonymous FTP to become active.

Once you have enabled the Anonymous FTP people will be able to connect to your hostname or IP Address without a username and password to upload files to your server. The users will be able to upload but will not be able to download files using the Anonymous FTP, this is to prevent people from using your machine to store illegal files.

As the admin you may login via FTP as the username "ftpadmin" with the password that is set inside the RAI to see what files people have uploaded, download whichever files you need, and delete files as necessary.
